Sliding scale

by David Lee, 1 Nov 2017, 2017

Sliding scale (variable-rate intravenous insulin infusion): What is an insulin 'sliding scale'?

A sliding scale or 'sliding scale' is a variable-rate intravenous insulin infusion used to manage blood glucose levels in patients with diabetes. It is a common practice in hospitals and is used to manage blood glucose levels in patients with diabetes. The sliding scale is a variable-rate intravenous insulin infusion used to manage blood glucose levels in patients with diabetes. It is a common practice in hospitals and is used to manage blood glucose levels in patients with diabetes.

Use of the sliding scale with gestational diabetes:

1. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

2. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

3. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

4. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

5. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

6. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

7. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

8. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

9. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

10. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

11. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

12. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

13. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

14. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

15. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.

16. During hospital admission, when blood glucose levels are over 100 mg/dL, good control can be achieved by using a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour. This may be used in the home, with a sliding scale of 1 unit/kg of insulin per hour.
